

RISK ASSESSMENT MODULE

RECORD THE ASSOCIATED HAZARDS

Record the hazards associated with activities, processes and proposed changes in a central database available to all stakeholders as and when required.

CUSTOMISED SEVERITY AND PROBABILITY SCALES

Using the severity and probability scales that you set up, the risk value is automatically calculated.

RECORD THE CONTROLS

When you record the controls you put in place, it will calculate the mitigating effect the controls will have on the associated risk and, as new controls are introduced, so the risk value is adjusted.

TABLET-BASED MODULE

There is also a tablet-based module that will allow you to record as you move around the workplace, even if you're offline. And you can photograph anything relevant to the activity or process being evaluated. When back in wireless reach, the details recorded may be uploaded into the central database and any documentation associated, into the document folder for the assessment.
